Garcia-Luque I., Farrero M.L., Vaquero C., Serra M.T., Diaz-Ruiz J.R.;
The nucleotide sequence of the coat protein genes and 3' non-coding
regions of two resistence-breaking tobamoviruses in pepper shows that
they are different viruses.";
Arch. Virol. 131:75-88(1993).
-!- SIMILARITY: Belongs to the tobamoviruses coat protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pepper mild mottle virus (strain Italian) (PMMV-I).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 (1)

PUCLECTIDE SEQUENCE (GENOMIC RNA).

Park B.K., Lee C.H., Lee Y.G., Lee Y.H.;

*Characterization of coat protein from TNV Korean tomato strain.";

*Submitted (AUG-1994) to the EMBL/GenBank/DDBJ databases.

-i- SIMILARITY: Belongs to the tobanoviruses coat protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tobacco mosaic virus.
Viruses; ssRNA positive-strand viruses, no DNA stage; Tobamovirus.

"The cost protein gene of Pepper Mild Mottle Virus isolated from Hot pepper in Korea.";
Submitted (NOV-1998) to the EMBL/GenBank/DDBJ databases.
-!- SIMILARITY: Belongs to the tobamoviruses cost protein family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pepper mild mottle virus (strain PO) (PMMV).
Viruses; ssRNA positive-strand viruses, no DNA stage; Tobamovirus.

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contign has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is generally based on at least 8% average coverage in Q20 bases and has been reviewed to rule out gross missasemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

Sequencing vector: plasmid; n/a; 100% of reads chamistry: Dye-terminator Big Dye; 100% of reads Assembly program: Phrap; version 0.990319

Consensus quality: 171366 bases at least Q20

Consensus quality: 171366 bases at least Q20

Insert size: 171834; sum-of-contigs

Quality coverage: 9.21x in Q20 bases; sum-of-contigs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           **NOTE: This is a 'working draft' sequence. It currently consists of a contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

Direct Submission
Submitted (31-JUL-2004) Human Genome Sequencing Center, Department Submitted (31-JUL-2004) Human Genome Sequencing cofficine, One Baylor Plaza, Houston, TX 77030, USA
On Jul 31, 2004 this sequence version replaced gi:48958568.
Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality does not meet this standard, it will be indicated in the annotation.

Homo sapiens chromosome 18, clone RP11-699A5, complete sequence.
AC022809
AC022809.6 GI:20429562
On Mar 23, 2001 this sequence version replaced gi:6957981.
Sequence submitted by:
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory, MS 64-121
Berkeley, CA 94720
This sequence was assembled using end sequences from a whole genome shotgun and from subclones of this BAC and its neighboring clones.
For further information about this sequence, including its location and relationship to other sequences, please visit our sequence archive Web site (http://www.fruitfly.org/sequence/) or send email to bdgp@fruitfly.berkeley.edu.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
